# 1 Introduction

Welcome to the UUU (Universal Update Utility), the next evolution of MFGTools, also known as MFGTools v3.

UUU is a tool designed for deploying images on Freescale/NXP iMX chips.

Over time, the demand for a cross-platform update utility that works seamlessly on both Linux and Windows has grown. UUU meets this need, offering identical functionality and usage on both operating systems, allowing the same scripts to run smoothly on either platform.

UUU is **command line tools**. look like

```
uuu (universal update utility) for nxp imx chips -- libuuu-1.0.1-gffd9837
```

```
Succues:0          Failure:3          Wait for Known USB Device Appear...
```

```
1:11      5/5 [          ] SDP: jump -f u-boot-dtb.imx - ↵  
      ivtinitramf....
```

```
2:1      1/5 [==>      ] SDP: boot -f u-boot-imx7dsabresd_sd. ↵  
      imx ....
```

UUU is designed as a common library and UI, making it easy for users to integrate the UUU library into their own tools. It also seamlessly runs within any scripts.

[PDF](#) version of the wiki content is available on the release page for convenience.

## 1.1 Running environment

- Windows 10, 64bit, early version(below 1.2.0) need install [vs2017 redistribute package](#)
- Ubuntu 16.14 or above, 64bit

**Windows 7 user please read [WIN7-User-Guide](#)**

## 1.2 Common Usage

Set the board's boot pin to USB serial download mode. In most cases, the iMX ROM will automatically fall back to USB serial download mode if there is a boot failure.

To download and boot U-Boot:

```
uuu bootloader
```

To burn U-Boot into eMMC:

```
uuu -b emmc bootloader
```

To burn the boot image into QSPI flash:

```
uuu -b qspi qspi_bootloader
```

To burn the root filesystem image into eMMC:

```
uuu -b emmc_all bootloader rootfs.wic
```

To decompress the root filesystem image and burn it into eMMC:

```
uuu -b emmc_all bootloader rootfs.wic.zstd
```

To decompress the root filesystem image and burn it into eMMC without the bootloader (since version 1.4.146 and after 2021 Q4 Yocto image):

```
uuu -b emmc_all rootfs.wic.zstd
```

**Notes:** "Bootloader" refers to a bootable image that includes the ROM-required header. For i.MX6 and i.MX7, this is typically `u-boot.imx`, while for i.MX8QXP, i.MX8QM, i.MX8MM, and i.MX8MQ, it is `flash.bin`.

To burn the release image into eMMC, use the following command:

```
uuu L4.9.123_2.3.0_8mm-ga.zip
```

**Note:** Some releases bundle multiple board configurations into a single zip package, use `uuu release.zip/uuu.auto-<boardname>`

For more usage details, please refer to the [Example](#).

### 1.3 UUU Script

UUU scripts are simple plain text files.

**The first line must be:**

```
uuu_version 1.0.1
```

The version number specifies the minimum UUU version required to parse and run the script.

After that, include the UUU commands.

UUU commands follow this format:

```
PROTOCOL: CMD
```

Here's an example script for booting U-Boot on i.MX6 and i.MX7:

```
uuu_version 1.0.1
SDP: dcd -f u-boot.imx
SDP: write -f u-boot.imx -ivt 0
SDP: jump -f u-boot.imx -ivt 0
```

For more sample scripts, see: [Sample-script\[\]](#).

The following table shows environment variables that may be useful when writing UUU scripts.

Table 2: Table Android Fastboot environment

| Variable                     | Description                                 |
|------------------------------|---|
| <code>fastboot_dev</code>    | fastboot flash device, support mmc and sata |
| <code>fastboot_buffer</code> | fastboot download buffer address            |
| <code>fastboot_bytes</code>  | fastboot download file size                 |
| <code>emmc_dev</code>        | eMMC device number                          |
| <code>sd_dev</code>          | sd slot device number                       |

| What you want | Required Firmware |
|---------------|-------------------|
|---------------|-------------------|

## 1.4 Firmware(default it is uboot) Requirements

| What you want                                 | Required Firmware                          |
|---|--|
| Download bootloader                           | N/A  |
| Burn Image to eMMC/SD                         | uboot with fastboot enable                 |
| Burn Image to qspi\spi\nor                    | uboot with fastboot enable                 |
| Burn Image into Nand flash                    | uboot(1), linux kernel\initramfs\uboot\dtb |
| Need linux shell cmd such as fdisk            | uboot(1), linux kernel\initramfs\uboot\dtb |
| Boot linux kenrel with rootfs already in eMMC | uboot with fastboot enable                 |
| Boot Linux kernel with nfs over USB           | uboot with fastboot enable, initramfs      |

(1) It's recommended to enable fastboot. If the ROM HID supports writing additional images to DDR, you can load the kernel, DTB, and initramfs to DDR before jumping to U-Boot. Enabling fastboot provides more flexibility for modifying the kernel command line.

## 1.5 Setup auto parameter complete

### 1.5.1 windows

Just power shell support customized auto complete

Powershell: Enjoy auto [tab] command complete by run below command or put into Documents\WindowsPowerShell\Microsoft.PowerS

```
Register-ArgumentCompleter -CommandName uuu -ScriptBlock {param($commandName, ↵
    $parameterName,$wordToComplete,$commandAst,$fakeBoundParameter); C:\Users\ ↵
    nxa23210\uuu\uuu\x64\Release\lib\uuu.exe -autocomplete $parameterName }
```

### 1.5.2 linux

Enjoy auto [tab] command complete by put below script into /etc/bash\_completion.d/uuu

```
_uuu_autocomplete()
{
    COMPREPLY=($( /home/lizhi/source/mfgtools/uuu/uuu $1 $2 $3))
}
complete -o nospace -F _uuu_autocomplete uuu
```

## 2 Syntactic

uuu (Universal Update Utility) for nxp imx chips -- libuuu\_1.5.191-1-g5d77a61

uuu [-d -m -v -V -bmap -no-bmap] <bootloader|cmdlists|cmd>

|            |                                       |
|------------|---------------------------------------|
| bootloader | download bootloader to board by usb   |
| cmdlist    | run all commands in cmdlist file      |
|            | If it is path, search uuu.auto in dir |
|            | If it is zip, search uuu.auto in zip  |
| cmd        | Run one command, use -H see detail    |
|            | example: SDPS: boot -f flash.bin      |

```

-d                Daemon mode, wait for forever.
-v -V            verbose mode, -V enable libusb error\warning info
-dry             Dry run mode, check if script or cmd correct
-bmap            Try using .bmap files even if flash commands do not specify ↵
                them
-no-bmap         Ignore .bmap files even if flash commands specify them
-m <usbpath>     Only monitor these paths.
                -m 1:2 -m 1:3

-ms <serial_no> Monitor the serial number prefix of the device using ' ↵
                serial_no'.
-t <timeout>     Timeout second for wait known usb device appeared
-T <timeout>     Timeout second for wait next known usb device appeared at ↵
                stage switch
-e <key=value>   set environment variable key=value
-pp <ms>         usb polling period in milliseconds
-dm             disable small memory
uuu -s          Enter shell mode. uuu.inputlog record all input commands
                you can use "uuu uuu.inputlog" next time to run all commands

uuu -udev        linux: show udev rule to avoid sudo each time
uuu -lsusb       List connected know devices
uuu -IgSerNum    Set windows registry to ignore USB serial number for known uuu ↵
                devices
uuu -h           show general help
uuu -H           show general help and detailed help for commands

uuu [-d -m -v -bmap -no-bmap] -b[run] <emmc|emmc_all|fat_write|nand|nvme_all|qspi| ↵
sd|sd_all|spi_nand|spl> arg...
    Run Built-in scripts
    emmc          burn boot loader to eMMC boot partition
                  arg0: _flash.bin  bootloader
                  arg1: _image[Optional]  image burn to emmc, default is the same as ↵
                  bootloader
    emmc_all       burn whole image to eMMC
                  arg0: _flash.bin  bootloader, which can extract from wic image
                  arg1: _image[Optional]  wic image burn to emmc.
    fat_write      update one file in fat partition, require uboot fastboot ↵
    running in board
                  arg0: _image  image, which cp to fat partition
                  arg1: _device  storage device, mmc\sata
                  arg2: _partition  fat partition number, like 1:1
                  arg3: _filename[Optional]  file name in target fat partition, only ↵
                  support rootdir now
    nand           burn boot loader to NAND flash
                  arg0: _flash.bin  bootloader
                  arg1: _image[Optional]  image burn to nand, default is the same as ↵
                  bootloader
    nvme_all       burn whole image io nvme storage
                  arg0: _flash.bin  bootloader, which can extract from wic image
                  arg1: _image[Optional]  wic image burn to emmc.
    qspi           burn boot loader to qspi nor flash
                  arg0: _flexspi.bin  bootloader
                  arg1: _image[Optional]  image burn to flexspi, default is the same ↵
                  as bootloader
    sd            burn boot loader to sd card
                  arg0: _flash.bin  bootloader

```

---

```

        arg1: _image[Optional]  image burn to emmc, default is the same as ↵
        bootloader
sd_all  burn whole image to sd card
        arg0: _flash.bin  bootloader, which can extract from wic image
        arg1: _image[Optional]  wic image burn to emmc.
spi_nand      burn boot loader to spi nand flash
        arg0: _flexspi.bin  bootloader
        arg1: _image[Optional]  image burn to fspinand, default is the ↵
        same as bootloader
spl        boot spl and uboot
        arg0: _flash.bin

```

```

uuu -bshow <emmc|emmc_all|fat_write|nand|nvme_all|qspi|sd|sd_all|spi_nand|spl>
    Show built-in script....

```

Notes: Some board supports super speed (USB3.0). USB 3.0 port path is difference ↵  
 USB 2.0. If use -m to filter port, you need add USB 3.0 port number otherwise ↵  
 fastboot will not be detected.

## 3 Usage Example

### 3.1 Basic

#### 3.1.1 Download boot loader for imx6\imx7

```
uuu uboot.imx
```

#### 3.1.2 Download boot loader for imx8qxp

```
uuu flash.bin
```

#### 3.1.3 Download SPL and uboot, such as imx8mq.

```

uuu sdp: boot -f flash.bin
uuu sdp: delay 1000
uuu sdp: write -f flash.bin -offset 0x57c00
uuu sdp: jump

```

#### 3.1.4 Burn Android Image to eMMC

```
uuu android.zip (not implement default yet)
```

#### 3.1.5 Burn yocto Image to eMMC

```
uuu L4.9.123_2.3.0_8mm-ga.zip
```

### 3.4.2 write image to emmc

```
uuu FB: flash -raw2sparse all <image file>
```

## 3.5 Talk with linux kenrel, transfer file between board and pc

```
on board, run \linuxrc&  
on pc,      uuu fbk:ucp file t:\file
```

## 4 Sample scripts

This pages list some examples on scripts to help UUU to make some tasks automatically.

Copy the source code to the file `uuu.auto` and execute the application executable file.

**# Download spl and uboot for imx8mm and imx8mq**

```
uuu_version 1.2.39
```

```
# This command will be run when i.MX6/7 i.MX8MM, i.MX8MQ  
SDP: boot -f _flash.bin
```

```
# This command will be run when ROM support stream mode  
# i.MX8QXP, i.MX8QM  
SDPS: boot -f _flash.bin
```

```
# These commands will be run when use SPL and will be skipped if no spl  
# SDPU will be deprecated. please use SDPV instead of SDPU  
# {  
SDPU: delay 1000  
SDPU: write -f _flash.bin -offset 0x57c00  
SDPU: jump  
SDPU: done  
# }
```

```
# These commands will be run when use SPL and will be skipped if no spl  
# if (SPL support SDPV)  
# {  
SDPV: delay 1000  
SDPV: write -f _flash.bin -skipspl  
SDPV: jump  
SDPV: done  
# }
```

**# Burn bootloader to eMMC boot partition**

```
uuu_version 1.2.39
```

```
# This command will be run when i.MX6/7 i.MX8MM, i.MX8MQ  
SDP: boot -f _flash.bin
```

```
# This command will be run when ROM support stream mode  
# i.MX8QXP, i.MX8QM

| FB   | winusb (windows), raw transfer by libusb |
| FBK  | winusb (windows), raw transfer by libusb |

## 5.1 SDP: i.MX6/7 ROM download protocol

### 5.1.1 Supported command:

Run DCD from image with ivt header

```
dcd -f <filename>
```

write image to address.

```
write -f <filename> [-addr 0x0000000] [-ivt 0]
```

ivt 0 means write to the address, which ivt pointer

jump to image with ivt header

```
jump -f <filename> [-ivt 0]
```

boot image, include (dcd, write and jump three commands)

```
boot -f <filename> [-nojump]
```

## 5.2 HABv4 closed chip support

For boot images not including a DCD table the same image used for SDCard/eMMC boot can be used with UUU tool.

For boot images including a DCD table, the DCD is loaded in OCRAM and must be properly signed.

Since U-Boot v2017.01 a build log containing the U-Boot and DCD addresses and lengths is available just after building U-Boot:

```
$ cat u-boot-dtb.imx.log
Image Type: Freescale IMX Boot Image
Image Ver: 2 (i.MX53/6/7 compatible)
Mode: DCD
Data Size: 602112 Bytes = 588.00 KiB = 0.57 MiB
Load Address: 877ff420
Entry Point: 87800000
HAB Blocks: 877ff400 00000000 0008ec00
DCD Blocks: 00910000 0000002c 000001c4
```

Users can copy the information above to create their CSF Authenticate Data command:

```
Block = 0x877ff400 0x00000000 0x0006DC00 "u-boot-dtb.imx", \
        0x00910000 0x0000002c 0x000001c4 "u-boot-dtb.imx"
```

Alternatively users can also extract the DCD length from the DCD table header:

```
$ od -x -j 0x2c -N 4 --endian=big u-boot-dtb.imx
0000054 d201 c440
0000060
DCD Header: 0xd2, DCD Length: 0x01c4, DCD Version: 0x40
```

For the i.MX devices not supporting the skip DCD command (i.MX6Dual/Quad and i.MX6Sololite) the pointer to the DCD table is cleared in the IVT in order to prevent the HAB library from processing the DCD table again during the authentication process. There is no need to re-initialize memory when it already contains valid data.

Since the IVT is modified when downloading to the target the binary must be signed with a cleared DCD pointer. However, the binary must be provided with a valid DCD pointer to allow the UUU tool to locate the DCD table.

The following script can be used to handle the DCD pointer:

```
#!/bin/bash
# DCD address must be cleared for signature, as UUU will clear it.
if [ "$1" == "clear_dcd_addr" ]; then
    # store the DCD address
    dd if=$2 of=dcd_addr.bin bs=1 count=4 skip=12
    # generate a NULL address for the DCD
    dd if=/dev/zero of=zero.bin bs=1 count=4
    # replace the DCD address with the NULL address
    dd if=zero.bin of=$2 seek=12 bs=1 conv=notrunc
fi
# DCD address must be set for mfgtool to localize the DCD table.
if [ "$1" == "set_dcd_addr" ]; then
    # restore the DCD address with the original address dd
    if=dcd_addr.bin of=$2 seek=12 bs=1 conv=notrunc
    rm zero.bin
fi
```

The steps below can be used as an example:

```
$ ./mod_4_mfgtool.sh clear_dcd_addr u-boot-dtb.imx
$ ./cst --i u-boot-csf.txt --o u-boot-csf.bin
$ ./mod_4_mfgtool.sh set_dcd_addr u-boot-dtb.imx
```

For the i.MX devices supporting the skip DCD command (i.MX7D, i.MX6UL/ULL, i.MX8MQ and i.MX7ULP), there is no need to do any modification, UUU tool can download the binary directly.

NOTICE: For i.MX7D only, due to an erratum, the UUU download DCD address (0x00911000) is not aligned with the DCD address in u-boot (0x00910000), there are two options:

- use the command to specify the DCD address, `uuu boot -f u-boot-signed.imx -dcdaddr 0x00911000`
- change the csf DCD address when signing the u-boot: `Blocks = 0x00911000 0x0000002c 0x0000001c4 "u-boot-dtb.imx`

### 5.3 SDPU\SDPV: uboot implement simplified ROM SDP protocol

Uboot implemented i.MX 6/7 ROM SDP protocol. The support command the same as SDP.

SDPV is upgrade version of SDPU, which support -skipspl option for write command

See below for uboot requirement [uboot-config-requirement](#)

### 5.4 SDPS: i.MX8QXP and i.MX8QM ROM download protocol

send image by sdp command.

```
boot -f <filename> [-offset 0x00000]
```

## 5.5 FB: Android fastboot protocol

refer [fast boot protocol](#)

See below for [uboot requirement](#)

### 5.5.1 Support command:

```
getvar
ucmd <any uboot command>
acmd <any never returned uboot command, like booti, reboot>

# partition "all" means whole device.
flash [-raw2sparse] <partition> <filename>
download -f <filename>
crc -f <filename> [-format "mmc read $loadaddr"]
                    [-blksz 512] [-crclblock 0x4000000]
                    [-seek 0] [-skip 0] [-nostop]
                    seek          skip block number from storage
                    skip          skips byte from -f
                    nostop        continue check even if found mismatch
```

**\*\*Some Uboot command need long time to finish. Default FB timeout is 2s. You can use below method to change timeout value**

```
# time out set to 10000ms
FB[-t 10000]: ucmd <any uboot command>
```

Table 5: Table Fastboot environment

| Variable                | Description   |
|-------------------------|---|
| fastboot_dev            | fastboot flash device, support mmc and sata                         |
| fastboot_buffer         | fastboot download buffer address                                    |
| fastboot_bytes\filesize | fastboot download file size, new uboot provide filesize environment |
| emmc_dev                | eMMC device number  |
| sd_dev                  | sd slot device number   |

## 5.6 FBK: Android fastboot protocol, implement at initramfs. See project [imx-uuc](#)

### 5.6.1 Support command:

```
ucmd <any kernel command> and wait for command finish
acmd <any kernel command> don't wait for command finish
sync                        wait for acmlid processs finish.
ucp <source> <destinate>   copy file from/to target
                           T:<filename> means target board file.
                           T:- means copy data to target's stdio pipe.
                           copy image T:/root/image ;download image to path /root/ ←
                           image
                           copy T:/root/image image ;upload /root/image to file ←
                           image.....
```

Example for transfer big file

```
acmd tar -                ; run tar background and get data from stdio
ucp rootfs.tar.gz T:-     ; send to target stdio pipe
sync                     ; wait for tar process exit.
```

Linux environment:

Each command in separate process so environment can not be affect next command. Use below method to workaround this problem.

```
FBK: ucmd source /tmp/mtd.sh; flash_erase /dev/mtd${nandrootfs} 0 0
```

## 5.7 Common command for all protocol

Table 6: Table Common command for all protocol

| Command  | Description  |
|----------|--|
| Done     | last command for finish whole flow.  |
| Delay    | Busy wait for millisecond  |
| SH/SHELL | run external command   |
| <        | stdout as command, such as "< echo ucmd print", which generally used for burn serial number                                      |
| @        | using environment variable, such as "FBK:@ ucmd echo @MSG@" MSG will be replace by OS's environment variable.                    |
| error    | show error message and exit  |
| if       | basic logic check, such as SDPS: if @chip@ == mx8qm then boot -f flash.bin. Only support == and !=. only support one logic check |

## 6 Migration from mfgtool ucl2.xml

\*\*Most case user can use uboot fastboot protocol to finish image program work.

In case you have to load kernel to burn whole image.

The below simple map ucl2.xml to uuu script.

| ucl2.xml   | uuu   |
|--|---|
| <CMD state="BootStrap" type="boot" body="BootStrap" file="firmware/flash.bin" ifdev="MX8QXPB0">Loading boot image</CMD>  | SDPS: boot -f flash.bin   |
| <CMD state="BootStrap" type="boot" body="BootStrap" file="firmware/flash.bin" ifdev="MX8MM">Loading U-boot</CMD>   | SDP: boot -f flash.bin SDP: boot -f flash.bin<br>SDPU: write -f flash.bin -offset 0x57c00<br>SDPU: jump |
| <CMD state="BootStrap" type="load" file="firmware/Image" address="0x80280000" loadSection="OTH" setSection="OTH" HasFlashHeader="FALSE" ifdev="MX8QXP MX8QM">Loading Kernel.</CMD> | FB: ucmd download -f Image  |

|   |  |
|---|--|
| <CMD state="BootStrap" type="load"<br>file="firmware/initramfs.cpio.gz.uboot"<br>address="0x83800000" loadSection="OTH"<br>setSection="OTH" HasFlashHeader="FALSE"<br>ifdev="MX8QM MX8QXP">Loading Initramfs.</CMD> | FB: ucmd download -f initramfs.cpio.gz.uboot   |

## 7 Win 7 User Guide

Win7 user may face some additional one time setup work because original win7 missed a updated .inf file

### 7.1 Back Ground

Win7 ships with correct *winusb.sys* file. but is missing an updated *.inf* that associates with "usb\ms\_comp\_winusb" devices. Normally if the USB device supports Microsoft OS descriptors, then it will allow Windows to automatically install the WinUSB driver. This mechanism is supported "in-box" for Win8 and newer. For Win7 the mechanism is supported through Windows update. Depending on the update policy for the Win7 machine, the appropriate driver may or may not be already available on the machine. If it is not already on the machine, user can use the following manual procedure to install the driver if necessary. (copy from [https://www.silabs.com/community/interface/knowledge-base.entry.html/2017/02/06/manually\\_installwin-A2Jj](https://www.silabs.com/community/interface/knowledge-base.entry.html/2017/02/06/manually_installwin-A2Jj)")

Some windows update also included updated .inf file. You can try run uuu to see what happen. If windows report "can't install driver", that means your system missed such update file.

### 7.2 Install updated winusb inf file

- [Download package](#)
- unzip
- run install.bat as administrator permission.

- The below screen show install success

```

C:\Windows\System32\cmd.exe

C:\Windows\system32>echo off
Administrative permission confirmed
===
Microsoft PnP Utility

Processing inf :          winusbcompat.inf
Driver package added successfully.
Published name :          oem8.inf

Total attempted:          1
Number successfully imported: 1

"SUCCESS: WINUSB WCID install"
Hit enter to close_

```

**Notes:**

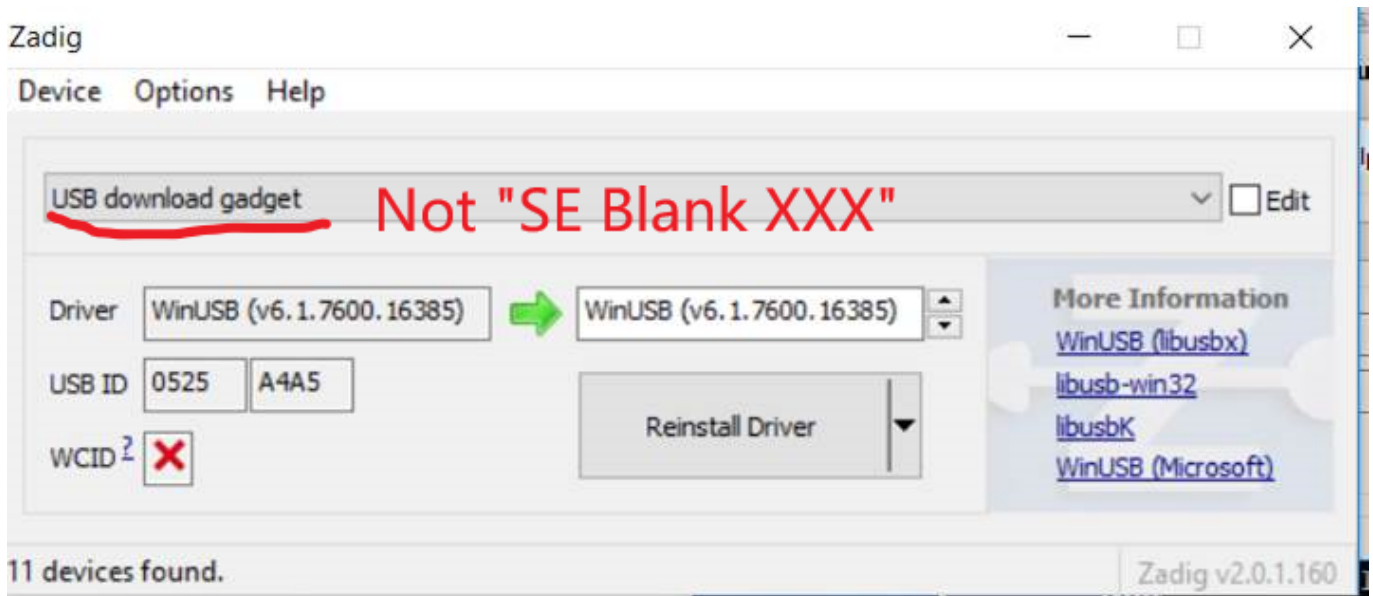

4.9.123 8MM GA and 4.14 beta release missed a patch. Please apply below [patch](#) in uboot

**7.3 Use zadig to install winusb driver**

Please make sure you success download uboot and uboot auto launch fastboot command. windows find **Usb download device**, NOT **SE Blank**

If still fail install winusb driver you can try below method. you can try download zadig from <https://zadig.akeo.ie/>

Choose **USB download device** and click install.

If you already apply patch and still see WCID is red "x", please submit issue.

**Notes:**

"SE Blank xx" is ROM HID device. PLEASE DON'T CHOOSE IT TO WINUSB. libusb can work well with HID device. Only "Usb download device" need check

## 8 FAQ

- **Win7 can't found driver**

- Need install winusb driver, you can use <https://zadig.akeo.ie/> to install winusb driver
- see page [WIN7-User-Guide](#)

- **Linux: Open device failure**

```
sudo uuu xxx
```

- **Some iMX8mm(845) chip failure write at linux system**

Need apply ROM patch, contact FAE to get it.

- **Failed with higher rate on i.MX8QXP C0 MEK board with Type-C port at linux system**

Linux Host PC to force USB driver behavior similar like Windows OS before ↔  
connecting.

```
echo Y > /sys/module/usbcore/parameters/old_scheme_first
```

- **How to use absolute path in scripts**

Default all paths in script is related uuu scripts. if you want to use absolute ↔  
path in scripts

Add ">" in path like

```
>/home/xxx
```

- **uuu exit silence or report missed dll**

Please upgrade to 1.2.x

- **How to avoid sudo in linux**

Put below context into /etc/udev/rules.d/99-uuu.rules (need sudo)

```
SUBSYSTEM=="usb", ATTRS{idVendor}=="1fc9", ATTRS{idProduct}=="012f", MODE="0666"

```

run `sudo udevadm control --reload-rules`

`uuu -udev` can show above help.

- **How to get file in zip without decompress**

Assume there are file name `uuu.auto` in `A.zip` file.

`A.zip/uuu.auto`

for example:

`uuu A.zip/uuu.auto`

- **How to send out uncompress bz2**

Added `/*` after `bz2` file

for example

`uuu -b emmc_all <bootloader> sdcard.bz2/*`

- **Boot fail after burn > 4G Image**

uboot need below patch

```

FB: Done
```

- **How to use uuu in docker**

libusb need udev event to get new devices appeared.

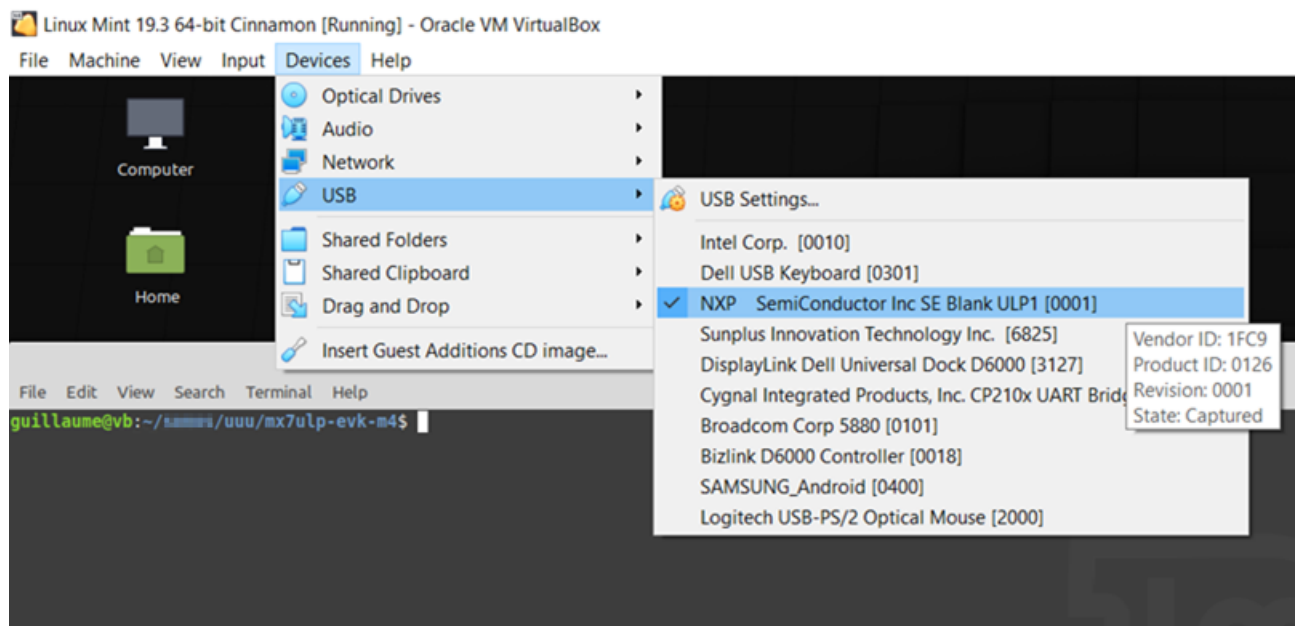

Added option

`docker run --net=host -v /run/udev/control:/run/udev/control`

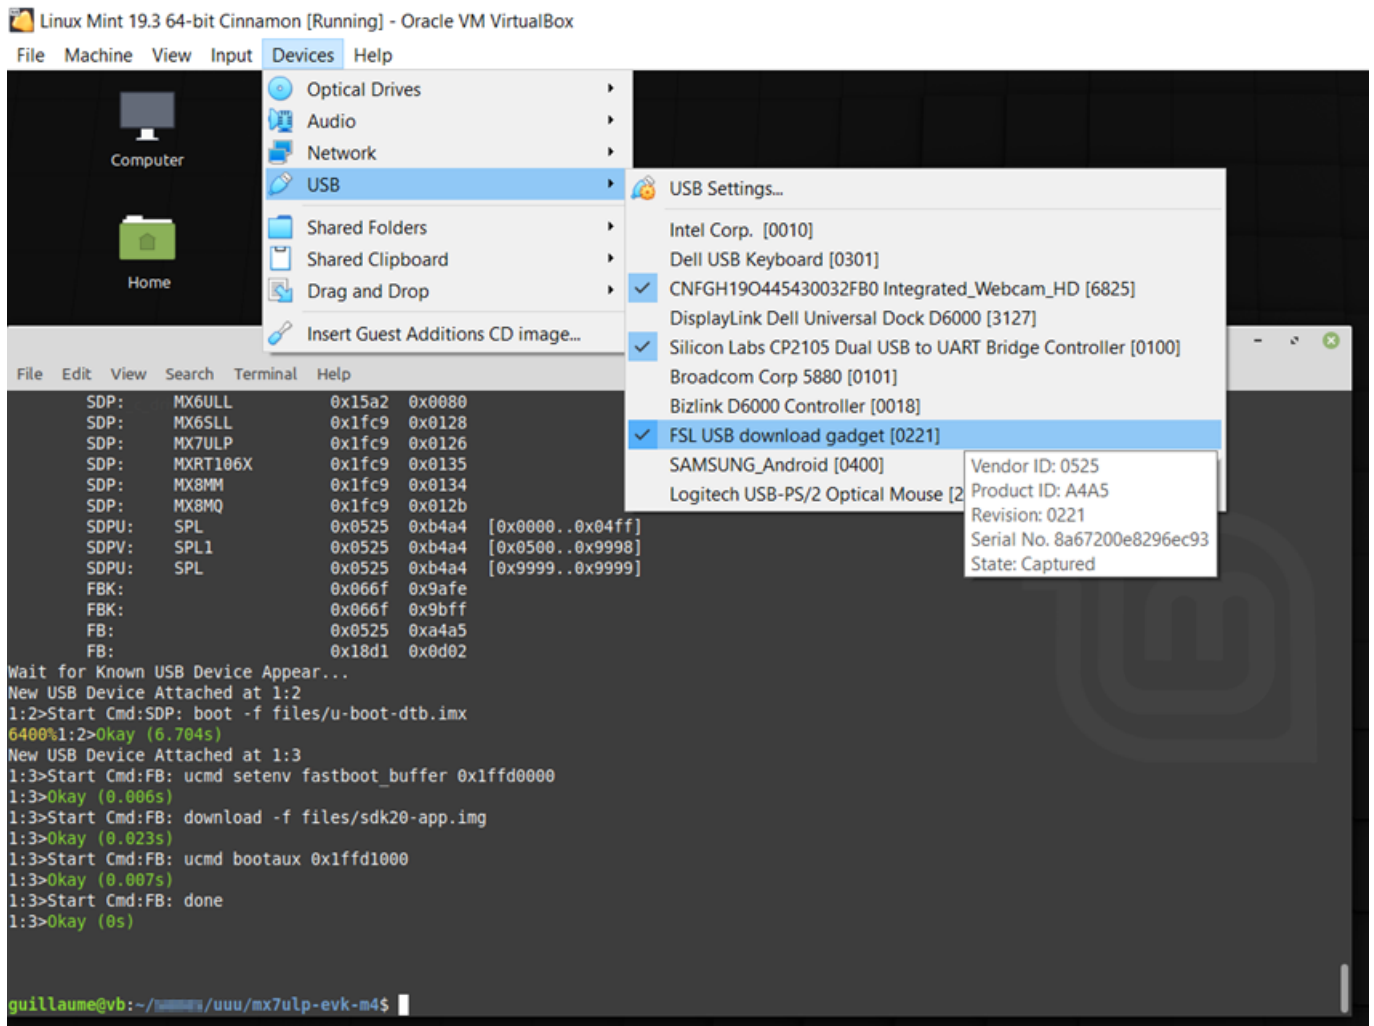

<https://stackoverflow.com/questions/49687378/how-to-get-hosts-udev-events-from-a-docker-container>

- **How to use uuu in virtual machine**

- Map HID device into virtual machine

- Map fastboot device into virtual machine after uboot boot

- You can use uuu burn image in virtual machine

## 9 Build Steps

### 9.1 windows

- download visual studio 2017 community version (free)
- git clone <https://github.com/NXPmicro/mfgtools.git>
- cd mfgtools
- git submodule init
- git submodule update
- open msvs/uuu.sln by vs2017
- click build

### 9.2 linux

- git clone <https://github.com/NXPmicro/mfgtools.git>

- cd mfgtools
- sudo apt-get install libusb-1.0.0-dev libzip-dev libbz2-dev
- cmake .
- make

## 10 Uboot config requirement

To talk with uuu, uboot need enable fastboot. fastboot need auto run when detect boot from USB.

```
CONFIG_CMD_FASTBOOT=y
CONFIG_USB_FUNCTION_FASTBOOT=y
CONFIG_USB_GADGET=y
CONFIG_USB_GADGET_DOWNLOAD=y
CONFIG_USB_GADGET_MANUFACTURER="FSL"
CONFIG_USB_GADGET_VENDOR_NUM=0x0525
CONFIG_USB_GADGET_PRODUCT_NUM=0xa4a5
CONFIG_CI_UDC=y                                # UDC need change according system, ↔
        some system use CONFIG_USB_DWC3, some use CONFIG_USB_CDNS3
CONFIG_FSL_FASTBOOT=y
CONFIG_FASTBOOT=y
CONFIG_FASTBOOT_BUF_ADDR=0x83800000            # Address need change according ↔
        system, generally it can be the same as ${LOADADDR}
CONFIG_FASTBOOT_BUF_SIZE=0x40000000
CONFIG_FASTBOOT_FLASH=y
CONFIG_FASTBOOT_FLASH_MMC_DEV=1
CONFIG_EFI_PARTITION=y
CONFIG_ANDROID_BOOT_IMAGE=y
```

If use SPL, SDP need be enabled.

```
CONFIG_SPL_USB_HOST_SUPPORT=y
CONFIG_SPL_USB_GADGET_SUPPORT=y
CONFIG_SPL_USB_SDP_SUPPORT=y
CONFIG_SDP_LOADADDR=0x40400000                # Address need change according ↔
        system, choose free memory
```

uuu related patches.

[https://source.codeaurora.org/external/imx/uboot-imx/log/?h=imx\\_v2017.03\\_4.9.123\\_imx8mm\\_ga](https://source.codeaurora.org/external/imx/uboot-imx/log/?h=imx_v2017.03_4.9.123_imx8mm_ga)

About Fastboot enable:

```
719651a MLK-18257-1 Enable fastboot support in qxp mek board
d5226a3 MLK-18257-2: fix fastboot build warning
219c989 MLK-18257-3 run fastboot if initramfs is in validate
09b1876 MLK-18257-4 use another method check if need run bootcmd_mfg
3b1fa9d MLK-18257-5 enhance fastboot uboot cmd
ca96e0b MLK-18406 fastboot support all partition
```

About uboot SDP enable:

```
192a26d MLK-18707-1: SDP: use CONFIG_SDP_LOADADDR as default load address
9764fb2 MLK-18707-2 iMX8M enable fastboot as default
db9a634 MLK-18862 imx8mm uuu can write emmc by fastboot
```

Additional environment need be define

Table 8: Table uuu environment

| Variable   | Usage                    | Description   |
|------------|--------------------------|---|
| emmc_dev   | emmc burn                | eMMC device number  |
| sd_dev     | burn sd                  | sd slot device number   |
| kboot      | boot kernel\burn nand    | kernel boot command, it is booti for arm64, bootz for arm32   |
| weim_uboot | burn weim nor            | uboot burn to position of weim nor  |
| weim_base  | burn weim nor            | weim base address   |
| mtdparts   | burn nand                | NAND flash partition configuration, such as "mtdparts=8000000.nor:1m(boot),-(rootfs)\;\;gpmi-nand:64m(nandboot),16m(nandkernel),16m(nandrootfs) " |
| spi_bus    | burn spi (not qspi\fspi) | spi nor flash bus number  |
| spi_uboot  | burn spi (not qspi\fspi) | spi nor flash uboot offset  |

## 11 kernel config requirement

Some kernel config required

- USB CONFIG FS need be built-in
- One of UDC driver and PHY need be built-in
- Function FS need be enabled

```

Device Drivers
USB support
    USB gadget support (very last entry)
        USB Gadget Drivers (...)
            USB functions configurable through configs
                Mass storage
                Function filesystem (functionFS)

```

## 12 Release Notes

### 12.1 1.5.163

#### 12.1.1 New features

- Support yocto bmap file to skip unused block
- Support i.MX95

#### 12.1.2 Bug fixes

- Fixed usb pipe error when download image with FCB

## 12.2 1.5.125

This is fixes up for 1.5.120

- force use old libusb to run at ubuntu 18.04

## 12.3 1.5.120

### 12.3.1 New features

- Add built spinand command support
- parser [-t timeout] for all protocol

## 12.4 1.5.109

This is fixes up for 1.5.104

- static link c++ library in prebuild linux image
- provide armlinux version image

## 12.5 1.5.104

### 12.5.1 New fetaures

- Using github working flow action to do release.
- Expand upload command, like uploading the value of a specific variable.

### 12.5.2 Bug fixes

- Fix segfault when boot data is zero in SDP.
- Fix issues when m\_skip is not zero in fastboot.
- Fix issues when file size isn't divisible by block size in fastboot.
- Fix read uploaded data for FB.

## 12.6 1.5.21

### 12.6.1 New features

- Reduce memory usage when burn single board with compressed Image.
- Http(s) prompt request username and passwords when require autherization.

### 12.6.2 Bug fixes

- fixed android super.img loop download 52byte after some block.
  - fix memory leak cause by getaddrinfo.
  - fix support of empty environment variables in Windows OS.
  - fix crash when environment variable is last word in script
-

## 12.7 1.4.243

### 12.7.1 New features

- Add zstd support
- Add iMX93 support

### 12.7.2 Bug fixes

- Fixed random crash when download bz2 from http
- Fix crash when download speed slower than decompress speed and need resize buffer

## 12.8 1.4.193

### 12.8.1 New features

- Add NXP FB/FBK/SDPV device PID

### 12.8.2 Bug fixes

- Fixed 314 Corrupt image with larger transfer sizes at sdp(s)
- Fixed missed true at else branch at built-in fat\_write script and nand\_burn\_loader
- Fixed invalid progress percentage in verbose mode
- Fixed QSPI flashing script
- Fix #297 print error when run quit cmd in shell mode
- Fix #180 support check getval return value

## 12.9 1.4.165

### 12.9.1 New features

- Burn wic file(after 2021 Q4 yocto image) directly. `uuu -b emmc_all wic`
- Add *upload* fastboot command support
- Support uboot that use plugin initialize ddr
- Support simple logical check in uuu script

### 12.9.2 Bug fixes

- fix buildin script bz2 have not replaced with bz2\\* if path included space
  - fixed #284: deadloop when using built-in script with filename include \_
  - Fix a potential crash if open usb device 400ms after detect attached
  - fix uuu return success even ucp failure
-

## 12.10 1.4.139

### 12.10.1 New features

- Add help option -IgSerNum to set windows registry to ignore serial number above too much entry in register when burn many boards.
- Add snap support
- Add 8ulp support
- Deploy mac image

### 12.10.2 Bug fixes

- Fixed missed last chunk when meet specific android sparse file
- return out of memory when allocate failure
- -bshow don't show uuu version information and recover cursor ESC

## 12.11 1.4.72

### 12.11.1 New features

- http\https add port support at url
- improve progress show when burn android sparse image

### 12.11.2 Bug fixes

- Fix the dead loop when flash specific android super.img. There are bug when split big super.img into small sparse file running time. The bug trigger if split point at whole sparse chunk.

## 12.12 1.4.43

### 12.12.1 New features

- add environment variable support command
- Added support for *FB:reboot* and *FASTBOOT:reboot*
- allow to pass sparse limit from command line
- Update version number support build number > 255
- Mac OS (Catalina) support

### 12.12.2 Bug fixes

- fix #193 fb:< echo ucmd print failure
  - fix fat\_write partition parser error
-

## 12.13 1.3.191

### 12.13.1 New features

- Added Boundary Devices fastboot IDs

### 12.13.2 Bug fixes

- Workaround problem: some data pattern cause timeout at dell docker hub.
- update 7D free memory address, errata e11166 [https://www.nxp.com/docs/en/errata/IMX7DS\\_3N09P.pdf](https://www.nxp.com/docs/en/errata/IMX7DS_3N09P.pdf)
- Fix can't build from source tarball.

## 12.14 1.3.154

### 12.14.1 New features

- ffu image basic support
- add boundary device VID/PID
- Added basic fastboot logical partition support

### 12.14.2 Bug fixes

- fastboot: fix oem command separator
- Fix crash when download bz2 file

## 12.15 1.3.134

### 12.15.1 Bug fixes

- fix qm\qxp download failure if use spl image

## 12.16 1.3.130

### 12.16.1 New features

- Add android fastboot continue command
  - Add i.MX8DXL support
  - Add i.MX865 support
  - build in script sd, support burn difference uboot
  - Add option -pp to set pool time
  - sdp: bootcmd: add support for --dcdaddr
  - change the default nandbcb command from update to init
-

### 12.16.2 Bug fixes

- fix one line miss when exit uuu
- fix show 99% when use bz2 file
- fix miss ucmd at nand built-in script
- fix show time wrong, use system time instead of tick as timesample

## 12.17 1.3.102

### 12.17.1 New features

- Support simple https. (experimental).
- -b option support script file
- support >=4G zip file

### 12.17.2 Bug fixes

- fixed #136 fix decompress failure if use uncompressed method in zip file.
- fixed something wait forever when download bz2 from http
- fix http request failure at some host (use \r\n at http request)

## 12.18 1.3.82

### 12.18.1 New features

- add dry-run option to check if all files exist at script
  - Start download before scan whole Bz2 file. Progress only show how many data burned instead of percentage before finish scan.
  - Add NAND built in script to burn boot loader into nand flash, which need uboot support nandbcb command
  - Add --skipfhdr option to skip flexspi header
  - Can use SD card uboot for flexspi, which need uboot support qspihdr command
  - Add timestamp info for each command. (-v show how many time is consumed for each command).
  - Add tar.bz2 support.(experimental).
  - Add tar.gz support. (experimental).
  - Add http download. (experimental).
  - Auto append /\* for bz2 file when use built-in script.
  - Add -lsusb option to list all connected known devices to help find usb path when do multi boards support
-

### 12.18.2 Bug fixes

- Fix SPL download uboot failure if uboot size > 2M
- Upgrade libusb to 1.0.23-rc3 to resolve some windows compatibility problem. such as exit if not usb port under virtual root hub.
- Fix bz2 decompress problem if bz2 created by bzip2 instead of pbzip2.
- Fix missed last chunk data for android sparse image
- fixed #123: implement timeout for wait known usb device appear

## 12.19 1.2.135

### 12.19.1 New features

- Support i.MX28
- Add Read\write a memory address for i.MX6/i.MX7
- built-in script emmc support burn difference files
- Support i.MX815

### 12.19.2 Bug fixes

- fix crash when console width between 47 to 54
- fix crash when use ssh <host> uuu
- fix wrong data by decompress sdcard.bz2/\* if enable -O2 build option

## 12.20 1.2.91

### 12.20.1 New features

- Auto parameter complete support
  - Add option -udev to help create udev rule to avoid use sudo
  - Remove VT color at win7
  - Fail back to verbose mode at win7
  - Enable uboot shell mode
  - Just print help when run uuu and doesn't scan auto.uuu in current directory.
  - Added blog command to fetch message from uboot boot log
  - Support file path include space. need add "" at file path
  - Windows version built-in libusb
  - New SDPV support to support -skipssl for uboot, which support auto scan uboot position.
-

### 12.20.2 Bug fixes

- Fixed uuu "fb[-t 1000]:" ucmd wait forever problem
- Fixed missed sdpu: done at spl built in script
- Fixed show nothing when wait for usb connection
- Fixed random claim interface failure at windows platform
- Fixed random crash when multi-device download at windows platform
- Fixed memory leak.
- Fixed #79 file all zero when ucp from target to host
- Fixed crash when done is not last cmd

## 12.21 1.2.0

### 12.21.1 New features

- Support decompress bz2 file, sdcard.bz2/\* means decompress it.
- Support enter shell after run script

### 12.21.2 Bug fixes

- Fix mx6 boot failure when enable security
- Fix windows version dependent on vs redistribute package

## 12.22 1.1.81

### 12.22.1 New features

- Support shell command
- Support shell command generate dynamic uuu command to burn sequence id, like MAC address
- Reduce cpu usage rate at windows platform by increase each bulk transfer size
- Added q(quit) to exit shell at -s mode

### 12.22.2 Bug fixes

- fixed some typo
  - fixed build script qspi burn failure if file size > 1M
  - fixed file locked by uuu to prevent user update it.
  - fixed crash at special uboot size
-

## 12.23 1.1.41

### 12.23.1 New features

- Support SDP protocol (i.MX6x, i.MX7, i.MX8M, i.MX8MM)
- Support SDPS protocol (i.MX8QXP B0, i.MX8QM B0)
- Support SDPU protocol (uboot\SPL implemented SDP protocol)
- Support FB protocol (fastboot with uboot)
- Support FBK protocol (fastboot in kernel, daemon implement at imx-uuc)
- Support multi-device download
- Support built-in script

### 12.23.2 Bug fixes

- Fix sometime open usb device failure at windows platform.
- Fix protocol case sensitive problem in script
- Fix open zip file failure

## 13 Known issue

- Some old i.MX8MM board HID can't work in linux system. Need apply ROM patch to fix. Please contact FAE.
  - QXP/QM NAND image can't download by UUU because alignment requirement is difference
  - Bz2 file only support one that is generated by pbbz2. there are problem if use bzip2 generate bz2.
  - i.MX815 only support 3 boards at the same time.
  - Some typeC dell dock USB hub cause transfer timeout if meet some magic data pattern, see branch magic\_pattern. Try use differece hub or direct connect to PC usb port if this happen.
-
